

# PREPARATION GUIDE

## ROOF PLAN

All roofs are delivered in kit form. Each bar length has been cut to length and pre-drilled in the appropriate position. Each section has an identification label. The position of these items are on a roof plan, which is included within the boxed components.

### Notes on sealants.

It is important that the whole conservatory is sealed with a LOW MODULUS NEUTRAL CURE sealant. For applications where the sealant will be wet for long periods eg. guttering, use a specialist sealant such as S40.

Ensure the top of the window frames are level, clean and dry.

Unpack the roof components and check against the roof plan supplied.

This will help familiarise you with the job at hand. Keep all plastic caps to one side and wrapped up - these items are easy to damage and may become brittle in colder weather.

Lay the remaining aluminium parts away from your main working area, again to avoid damage, leaving all bar identification numbers visible.

Check the frame to eaves fixing arms are in the correct position on the eaves beam.
